

Olist E-Commerce One-Page Insight Summary

A concise business readout of customer behavior, spending, repeat purchasing, and product-category performance across the Olist marketplace dataset.

3.12%

of customers placed more than one order within the observed period

4.67%

of customers with matching payment records spent R\$500 or more

9.26%

of total product revenue came from the highest-revenue category

DATA OVERVIEW

The Olist e-commerce dataset contains nine related tables covering customers, orders, payments, order items, products, reviews, sellers, geolocation, and category translation. This capstone uses six core tables to analyze customer, revenue, and product performance across purchases recorded from September 4, 2016 to October 17, 2018. The analysis identifies 96,096 unique customer identities, while 96,095 have matching payment records for spend segmentation. The monthly series has a missing November 2016 record and sparse boundary months, so time-based results should be interpreted as observed-period activity rather than a perfectly continuous calendar series.

THREE BUSINESS INSIGHTS

1

Repeat purchasing is limited

96.88% of customers placed only one order, while just **3.12%** purchased more than once during the observed period. This makes second-purchase behavior an important area for deeper customer analysis, while recognizing that purchases outside the dataset window are not captured.

2

Most customers remain below R\$500 in spend

95.33% of customers with matching payment records spent below R\$500, and only **4.67%** reached the High-spend tier of R\$500 or more. The High-spend group is therefore small enough to profile separately for frequency, category preferences, and repeat behavior.

3

No single category dominates product revenue

health_beauty generated the most product revenue at **R\$1,258,681.34**, but represented only **9.26%** of total product revenue. Revenue is therefore not heavily dependent on one category in the observed dataset.

TWO RECOMMENDATIONS

RECOMMENDATION 1

Investigate the path to a second purchase

Compare repeat behavior by first-purchase category, initial order value, customer cohort, and time to second order. Use those findings to identify which customer groups are most appropriate for targeted post-purchase and retention initiatives rather than applying the same approach to every one-time buyer.

RECOMMENDATION 2

Build a high-value customer and category watchlist

Profile the R\$500+ segment by order frequency, repeat rate, and category affinity, while monitoring monthly category revenue and share. This creates a practical BI view for tracking valuable customer behavior and emerging category shifts without assuming that today's leading category will remain dominant.
